

PAR4® **Organic 9-3-7** organic fertilizer is made from natural

ingredients, not manure or compost-based products. The combination of sterile feather meal, bone meal and potash provide the right amount of N-P-K nutrients for plants over an extended period of time. Also, trace elements, found in feather/bone meals provide additional plant growth benefits. Unlike manures and many other organic fertilizers, PAR4 9-3-7 provides slow-release of nutrients by the inherent properties of the ingredients and through natural occurring microbial activities in soils. PAR4 9-3-7's slow-release of nutrients is not restricted by temperature threshold like those of costly, slow release synthetic fertilizers. Ultimately, fertility costs are reduced through fewer applications.

And because PAR4 9-3-7 is organic and releases lower levels of N-P-K over an extended period, environmental impacts to waterways and aquatic organisms are minimal to non-existent. PAR4 9-3-7 is relatively dust-free and can be applied with any standard fertilizer equipment. It is also suitable for nursery soil mixing and containerized plant applications. Refer to package directions for proper crop application intervals and rates.

PAR4® 9-3-7: Animal protein-based organic fertilizer for superior plant growth. Manufactured using feather meal, bone meal and potassium sulfate, 9-3-7 organic fertilizer is the perfect solution for almost any plant application. Whether you are seeking better crop yields, turf or plant growth, 9-3-7 provides essential mineral nutrients for proper plant growth and health.

Packaging Options: available in 50lb and bulk bags. FOB Stockton California.
